BOA demo application

url: http://www.abowebhosting.be/boa

Login:

I have created 4 users for different languages:

- User en with password en01 for English
- User fr with password fr01 for French
- User de with password de01 for German (sorry for bad translations ☺)
- User nl with password nl01 for Dutch

Once logged in, you will see the main menu. At this time there is only a menu at the left, a top menu is in development. There are some options as Customer and Supplier. Below you see the option where you can test the different types of grids and forms. Some of them creates a new tab, others are modal. Some of them has forms with multiple tabs.

If you check for the customers, you can filter. In this demo I added 35.000 addresses with 184.000 contacts, so you can see the speed as in a production environment.

You can test to filter customers on:

- Vandeb which gives 242 customers with the name VANDENB*
- *SERVICE which gives 116 customers with somewhere SERVICE in the name or contact.
- *373647 which is part of a phone number.
- =30008 which gives the customer with ID 30008.
- *omzet>5000 which gives the customers with sales > 5000

The customer 30008 also has data in the different tab pages for testing.

If you are in the address tab page of a customer, you can see the ZIP code. You can try the following:

- 8340 to search. This will give 6 results as zip-code.
- *GEM this will give about 130 results

Once you selected a zip code, the City field is automatically refreshed. This shows how relations can work to select data from other tables.
