## INTRODUCTION

A business application that will be used in different countries must allow the user of that application to translate inscriptions, titles, messages and other texts in the application into their local language. Such an application should fulfill two conditions:

1. This translation for any user of the application should be quick and easy and not related to knowledge of the operating system and programming.
2. Also, programming the application for this translation should be quick and easy for the application developer.

Here I will provide one of the many possible ways to fulfill both of these conditions with explanations and with the source code of the application.

Note:

The technique presented here is based on an excellent idea and a very good solution given by Roger Donnay in the eXpress++ libraries through the functions: dc\_langset(), dc\_langmsg(), dc\_langblock() in the program \_DCLANG.PRG, DCLIPX.LIB. I used Roger's code by partially simplifying it and adding a DBF file that stores a dictionary for the two languages ENGLISH and LOCAL and a mechanism for modifying that dictionary by the application user (and also by the application developer).

In this solution, the business application has the ability to permanently store two dictionaries in the LANGUAGE.DBF database: a dictionary for the English language (default) and a dictionary for the local language. When the application starts, the file LANGUAGE.DBF is created automatically.

The user of the application cannot change the dictionary for the English language. It can change the local language dictionary from the active application.

It is understood that the user of the application cannot add new items to the dictionary and delete existing items from the dictionary. He can only write its translation in the local entry against the English entry.

The application developer can change both dictionaries, can add and delete items in both dictionaries, and can create a text file with the source code from the file LANGUAGE.DBF that is embedded in the CH file of the application (which greatly reduces the work on coding that file).

During the operation of the application, the user of the application can change the language with which the application works from only English to local and only from local to English.

If the user of the application wants to have two different local languages (which is a rare case), he must create two files LANGUAGE.DBF, each file with its own local language, and change them in the application.

## UVOD

Poslovna aplikacija koja će se koristiti u različitim državama mora da omogući korisniku te aplikacije da natpise, naslove, poruke i druge tekstove u aplikaciji, prevede na svoj lokalni jezik. Takva aplikacija treba da ispunjava dva uslova:

1. Ovo prevodenje za bilo kog korisnika aplikacije bi trebalo da bude brzo i jednostavno i nevezano za poznavanje operativnog sistema i programiranja.
2. Takođe, programiranje aplikacije za ovo prevodenje, trebalo bi i za programera aplikacije da bude brzo i jednostavno.

Ovde ću dati jedan od mnogo mogućih načina za ispunjenje oba ova uslova sa objašnjenima i sa izvornim kodom aplikacije.

Napomena:

Tehnika koja je izložena ovde bazira se na odličnoj ideji i jako dobrom rešenju koje je dao Roger Donnay u eXpress++ bibliotekama kroz funkcije: dc\_langset(), dc\_langmsg(), dc\_langblock() u programu \_DCLANG.PRG, DCLIPX.LIB.

Ja sam iskoristio Rogerov kod tako što sam ga delimično uprostio i što sam mu dodao DBF fajl koji čuva rečnik za dva jezika ENGLSKI i LOKALNI i mehanizam za izmenu tog rečnika od strane korisnika aplikacije (a takođe i od strane programera aplikacije).

U ovom rešenju poslovna aplikacija ima mogućnost da u LANGUAGE.DBF bazi podataka trajno čuva dva rečnika: rečnik za engleski jezik (default) i rečnik za lokalni jezik. Startom aplikacije fajl LANGUAGE.DBF se automatski formira.

Korisnik aplikacije ne može da menja rečnik za engleski jezik. On može da menja rečnik za lokalni jezik iz aktivne aplikacije.

Podrazumeva se da korisnik aplikacije ne može da dodaje nove stavke u rečnik i da briše postojeće stavke iz rečnika. Može samo da naspram engleske stavke upiše njen prevod u lokalnu stavku.

Programer aplikacije može da menja oba rečnika, može da dodaje i da briše stavke u oba rečnika i može da iz fajla LANGUAGE.DBF formira tekst fajl sa izvornim kodom koji se ugrađuje u CH fajl aplikacije (što jako smanjuje posao na kodiranju tog fajla).

U toku rada aplikacije korisnik aplikacije može da promeni jezik sa kojim aplikacija radi samo sa engleskog na lokalni i samo sa lokalnog na engleski.

Ako korisnik aplikacije hoće da ima dva različita lokalna jezika (što je redak slučaj) mora da napravi dva fajla LANGUAGE.DBF, svaki fajl sa svojim lokalnim jezikom, pa da ih menja u aplikaciji.

## 1. LANGUAGE DATABASE – JEZIČKA BAZA PODATAKA

In the application, the English language (picture 1) should be (automatically) replaced by the local language (picture 2) on command buttons (or other objects) and vice versa.

U aplikaciji treba da se (automatski) na komandnim dugmadima (ili drugim objektima) engleski jezik (slika 1) zameni lokalnim jezikom (slika 2) i obrnuto.

slika 1

slika 2

1. First, you need to set up and fill the language database LANGUAGE.DBF (picture 3), which already exists in the application (if it is not there - it is created when the application is first started)

1. Prvo treba postaviti i napuniti jezičku bazu podataka LANGUAGE.DBF (slika 3) koja već postoji u aplikaciji (ako je nema – formira se kod prvog starta aplikacije)

slika 3

LANGUAGE SETTING :: ENGLISH and LOCALE			
RESULT CODE	SYMBOLIC CONSTANT	MESSAGE ENGLISH LANGUAGE	MESSAGE LOCAL LANGUAGE
71	_EXISTYES_	Exists	Postoji
72	_EXISTNO_	Not exists	Ne postoji
73	_START_	Start	Početak
74	_END_	End	Kraj
75	_LOCALE_	Set language to locale	Postavi jezik na lokalni
76	_ENGLISH_	Set language to english	Postavi jezik na engleski
300	_APPNAME_	LANGUAGE SETTING :: ENGLISH and LOCALE	POSTAVKA JEZIKA :: ENGLEDKI i LOKALNI
301	_ENG_	ENGLISH	ENGLESKI
302	<b>LOC_</b>	LOCALE	LOKALNI

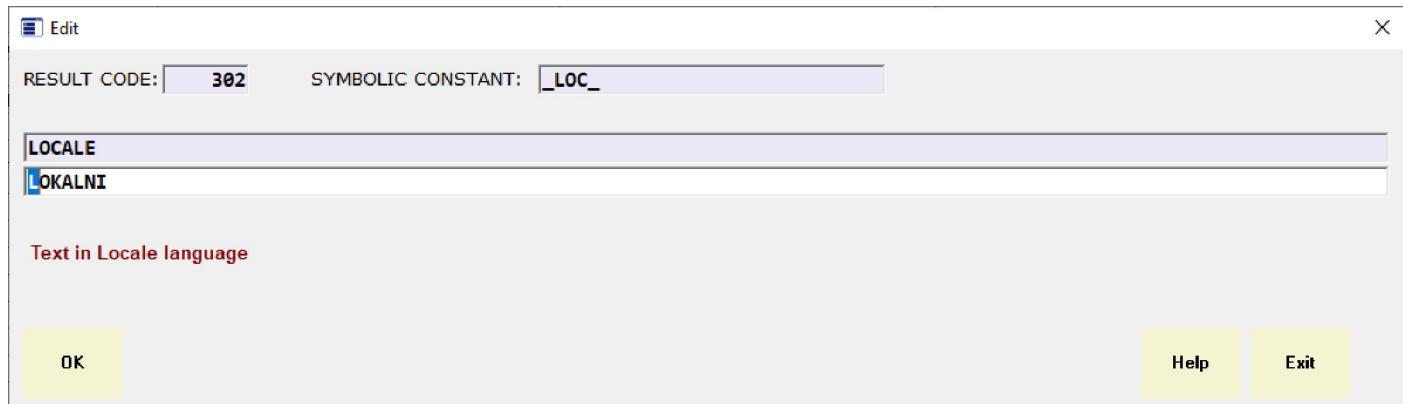

By default, the file LANGUAGE.DBF contains the English language and as the local language it contains the Serbian language (the language of the program author). The application user will translate this MESSAGE LOCAL LANGUAGE local language dictionary into their own language. The data entered in the RESULT CODE, SYMBOLIC CONSTANT and MESSAGE ENGLISH LANGUAGE columns were set by the application developer and cannot be changed by the application user.

Po default-u fajl LANGUAGE.DBF sadrži engleski jezik a kao lokalni jezik sadrži srpski jezik (jezik autora programa). Korisnik aplikacije će ovaj rečnik lokalnog jezika MESSAGE LOCAL LANGUAGE prevesti na svoj jezik. Podatke upisane u kolone RESULT CODE, SYMBOLIC CONSTANT i MESSAGE ENGLISH LANGUAGE postavio je programer aplikacije i te podatke korisnik aplikacije ne može menjati.

When the application is started, the item to be changed is selected and **Edit** command button is clicked (picture 1) and a dialog for editing is displayed (picture 4)

Kada se aplikacija startuje, selektuje se stavka koja se menja i klikne se na komandno dugme **Edit** (slika 1) i dobije se dialog za izmenu (slika 4)

slika 4

The user of the application will enter a word from his language here as a translation of the English word. The user of the application can correct some text in the ENGLISH field, but it is possible to prohibit him from doing so and this should be a practice.

Korisnik aplikacije ovde će upisati reč iz svog jezika kao prevod engleske reči. Korisnik aplikacije može da koriguje neki tekst u polju ENGLISH ali mu je to moguće zabraniti i to bi trebalo da bude praksa.

The developer of the application can make an entry in all four fields: RESULT CODE, SYMBOLIC CONSTANT, ENGLISH, LOCALE if the application is in the operating mode: "only for developer" or if there is a file named "lProtect" in the EXE folder of the application. If this file does not exist, entry in the RESULT CODE and SYMBOLIC CONSTANT fields is blocked.

Programer aplikacije može izvršiti upis u sva četiri polja: RESULT CODE, SYMBOLIC CONSTANT, ENGLISH, LOCALE ako je aplikacija u modu rada: "samo za programera" odnosno ako u folderu EXE aplikacije postoji fajl sa nazivom "lProtect". Ako ovaj fajl ne postoji upis u polja RESULT CODE i SYMBOLIC CONSTANT je blokiran.

## 2. APPLICATION USER - KORISNIK APLIKACIJE

From everything that has been said so far, the user of a business application translates that application into his local language by starting the LANGUAGES.EXE LANGUAGE SETTING :: ENGLISH and LOCALE (picture 3) program from that application, which is located in the application's folder or is embedded in the application itself and is started as one of the application's operations.

Iz svega do sada rečenog, korisnik poslovne aplikacije prevodi tu aplikaciju na svoj lokalni jezik tako što iz te aplikacije startuje program LANGUAGES.EXE LANGUAGE SETTING :: ENGLISH and LOCALE (slika 3) koji se nalazi u folderu te aplikacije ili je ugrađen u samu aplikaciju i startuje se kao jedna od operacija aplikacije.

After starting the LANGUAGE SETTING :: ENGLISH and LOCALE program, the user of the application clicks on the Edit command button (picture 1) to change the text in the local language field, i.e. in the MESSAGE LOCAL LANGUAGE column. When finished with these changes, the application user should click on the LOCALE command button (pictures 1 and 2) and restart the application. And that is all. There are no other operations for the application user.

Posle starta programa LANGUAGE SETTING :: ENGLISH and LOCALE korisnik aplikacije klikom na komandno dugme Edit (slika 1) menja tekst u polju za lokalni jezik odnosno u koloni MESSAGE LOCAL LANGUAGE. Kada završi sa ovim izmenama korisnik aplikacije treba da klikne na komandno dugme LOCALE (slika 1 i 2) i da restartuje aplikaciju. I to je sve. Nema drugih operacija za korisnika aplikacije.

### 3. APPLICATION PROGRAMMER - PROGRAMER APLIKACIJE

From everything that has been said so far, the developer of a business application has a slightly bigger job than the user of the application, which I further describe and document here with the source code of the application.

Iz svega do sada rečenog, programer poslovne aplikacije ima malo veći posao od korisnika aplikacije koji ovde na dalje opisujem i dokumentujem sa izvornim kodom aplikacije.

The programmer of a business application must create a separate LANGUAGES.EXE program for that application to work with multiple languages (which is shown in this material), or incorporate functions from LANGUAGES.EXE program into the business application and use them from the business application. Each business application has its own different LANGUAGES.EXE program.

Programer poslovne aplikacije mora da za tu aplikaciju napravi poseban LANGUAGES.EXE program za rad aplikacije sa više jezika (koji je prikazan u ovom materijalu), ili da funkcije iz programa LANGUAGES.EXE ugradi u poslovnu aplikaciju i da ih koristi iz poslovne aplikacije. Svaka poslovna aplikacija ima svoj različit program LANGUAGES.EXE.

The programmer starts the **LANGUAGE.EXE** and **Edit** program and enters the columns: RESULT CODE, SYMBOLIC CONSTANT, MESSAGE ENGLISH LANGUAGE, MESSAGE LOCAL LANGUAGE. Lines from RESULT CODE 1 to RESULT CODE 300 are reserved for basic messages that any business application can contain. Lines from RESULT CODE 300 onwards are used for messages and other texts contained in the specific business application for which the LANGUAGES.EXE program is being created.

Programer startuje program **LANGUAGE.EXE** i **Edit** pa izvrši upis u kolone: RESULT CODE, SYMBOLIC CONSTANT, MESSAGE ENGLISH LANGUAGE, MESSAGE LOCAL LANGUAGE. Redovi od RESULT CODE 1 do RESULT CODE 300 rezervisani su za bazne poruke koje može da sadrži svaka poslovna aplikacija. Redovi od RESULT CODE 300 pa na dalje koriste se za poruke i druge tekstove koje sadrži konkretna poslovna aplikacija za koju se program LANGUAGES.EXE pravi.

**RESULT CODE** is a non-repeating number that is used as a numeric value - as a numeric code - for a symbolic constant in the **LANGUAGES.CH** file of the **LANGUAGES.EXE** program and the corresponding business application

**RESULT CODE** je numerik koji se ne sme ponoviti a koji se koristi kao numerička vrednost - kao numerički kod - za simboličku konstantu u **LANGUAGES.CH** fajlu programa **LANGUAGES.EXE** i odgovarajuće poslovne aplikacije

**SYMBOLIC CONSTANT** is a non-repeating string that is used as a symbolic constant in the **LANGUAGES.CH** file of the **LANGUAGES.EXE** program and the corresponding business application.

**SYMBOLIC CONSTANT** je string koji se ne sme ponoviti a koji se koristi kao simbolička konstanta u **LANGUAGES.CH** fajlu programa **LANGUAGES.EXE** i odgovarajuće poslovne aplikacije.

An example of a code case in the file **LANGUAGES.CH**  
Primer dela koda u CH fajlu **LANGUAGES.CH**

```
// SYMBOLIC CONSTANT      RESULT CODE
#define _START_          73 // Start // Početak
#define _END_            74 // End   // Kraj
#define _LOCALE_         75 // Set language to locale // Postavi jezik na lokalni
#define _ENGLISH_        76 // Set language to english // Postavi jezik na engleski

#define _APPNAME_        300 // LANGUAGE SETTING :: ENGLISH and LOCALE
                           // POSTAVKA JEZIKA :: ENGLEDKI i LOKALNI
#define _ENG_             301 // ENGLISH // ENGLESKI
#define _LOC_             302 // LOCALE  // LOKALNI
```

**MESSAGE ENGLISH LANGUAGE** is a string or text in English  
**MESSAGE LOCALE LANGUAGE** is a string or text in the local language

**MESSAGE ENGLISH LANGUAGE** je string odnosno tekst na engleskom  
**MESSAGE LOCALE LANGUAGE** je string odnosno tekst na lokalnom jeziku

#### An example of how the application uses languages:

The title of the main application window is set from the following code:

```
DCREAD GUI OPTIONS GetOptions FIT TITLE LNG_MSG(_APPNAME_)
```

In the **LNG\_MSG(\_APPNAME\_)** function, the symbolic constant **\_APPNAME\_** is written as a function parameter. This symbolic constant is a numeric whose value is **300**.

The **LNG\_MSG(\_APPNAME\_)** function finds in the **LANGUAGE.DBF** database in the **RESULT CODE** column a line whose code is = **300**, and takes the **TEXT** content of the field from that line:

```
MESSAGE ENGLISH LANGUAGE = "LANGUAGE SETTING :: ENGLISH and LOCALE"
MESSAGE LOCAL LANGUAGE   = "LANGUAGE SETTING :: ENGLISH and LOCAL"
```

If the file **LANGUAGES.INI** is written:

```
[LANGUAGE]
applanguage=ENG
the title of the window will display the text: "LANGUAGE SETTING :: ENGLISH and
LOCAL"
```

If the file **LANGUAGES.INI** is written:

```
[LANGUAGE]
applanguage=LOC
the title of the window will display the text: "LANGUAGE SETTING :: ENGLISH and LOCAL"
```

### Primer kako aplikacija koristi jezike:

Naslov glavnog prozora aplikacije postavlja se iz sledećeg koda:

```
DCREAD GUI OPTIONS GetOptions FIT TITLE LNG_MSG(_APPNAME_)
```

U funkciju `LNG_MSG(_APPNAME_)` upisana je simbolička konstanta `_APPNAME_` kao parametar funkcije. Ova simbolička konstanta je numerik čija vrednost je 300.

Funkcija `LNG_MSG(_APPNAME_)` pronađe u bazi podataka LANGUAGE.DBF u koloni RESULT CODE red čiji je kod = 300 pa iz tog reda preuzme TEKST sadržaj polja:

```
MESSAGE ENGLISH LANGUAGE = "LANGUAGE SETTING :: ENGLISH and LOCALE"  
MESSAGE LOCAL LANGUAGE = "POSTAVKA JEZIKA :: ENGLEDKI i LOKALNI"
```

Ako je u fajl `LANGUAGES.INI` upisano:

```
[LANGUAGE]  
applanguage=ENG
```

u naslovu prozora biće prikazan tekst: "LANGUAGE SETTING :: ENGLISH and LOCALE"

Ako je u fajl `LANGUAGES.INI` upisano:

```
[LANGUAGE]  
applanguage=LOC
```

u naslovu prozora biće prikazan tekst: "POSTAVKA JEZIKA :: ENGLESKI i LOKALNI"

---

## 4. APPLICATION PROJECT AND APPLICATION BUILDING - PROJEKAT I IZGRADNJA APLIKACIJE -

Required resources to build the `LANGUAGES.EXE` application

Potrebni resursi za izgradnju aplikacije `LANGUAGES.EXE`

In order for all of this to work, programs must be linked to the `LANGUAGES.EXE` application:

Da bi sve ovo funkcionalo u aplikaciju `LANGUAGES.EXE` moraju se linkovati programi:

```
LANGUAGES.PRG,  
__LANGUAGES.PRG,  
LANGUAGES.CH
```

Both PRG programs must include the file: #include `LANGUAGES.CH`. In that case, the main program of the `LANGUAGES.PRG` application must have procedures:

Oba PRG programa moraju imati uključen fajl: #include `LANGUAGES.CH`. U tom slučaju glavni program aplikacije `LANGUAGES.PRG` mora imati procedure:

```
APPSYS(),  
DBESYS(),  
MAIN()
```

The **LANGUAGES.PRG** program contains procedures and functions:

Program **LANGUAGES.PRG** sadrži procedure i funkcije:

**PROCEDURE APPSYS()**,

**PROCEDURE DBESYS()**,

**PROCEDURE MAIN()**

**FUNCTION MAKE\_LANGUAGE()**

**STATIC FUNCTION INSERT\_ITEM()**

**STATIC FUNCTION DELETE\_ITEM()**

**STATIC FUNCTION EDIT\_LANGUAGE()**

**STATIC FUNCTION CH\_file()**

**STATIC FUNCTION help\_programa()**

The **\_LANGUAGES.PRG** program contains functions:

Program **\_LANGUAGES.PRG** sadrži funkcije:

**FUNCTION LNG\_MSG( nMessage )**

**FUNCTION LNG\_SET( applanguage, lSet, aLanguage )**

**FUNCTION create\_language\_list(LNGFILE)**

**STATIC FUNCTION fill\_language\_list(LNGFILE)**

**FUNCTION dc\_langblock ( bBlock )**

**FUNCTION dc\_langcustom( bBlock )**

There must also be files in the **LANGUAGES.EXE** application folder

Takođe u folderu aplikacije **LANGUAGES.EXE** moraju postojati fajlovi

**LANGUAGES.DBF**

**LANGUAGES.INI**

The helper program **LANGUAGES.EXE** created in this way for the business application **APP.EXE** is located in the same folder as the **APP.EXE** application and is started either from this application or independently. This program allows the user of the **APP.EXE** application to set the operation of the application to English or to the local language. It also allows the **APP.EXE** user to make the necessary local language changes.

Tako napravljen pomoćni program **LANGUAGES.EXE** za poslovnu aplikaciju **APP.EXE** nalazi se u istom folderu u kome se nalazi i aplikacija **APP.EXE** i startuje se ili iz ove aplikacije ili samostalno. Ovaj program dozvoljava korisniku aplikacije **APP.EXE** da podeši rad aplikacije na engleski jezik ili na lokalni jezik. Takođe dozvoljava korisniku aplikacije **APP.EXE** da izvrši potrebne izmene u lokalnom jeziku.

#### Required resources to build a business application **APP.EXE**

#### Potrebni resursi za izgradnju poslovne aplikacije **APP.EXE**

If the technology for working with multiple languages in one business application **APP.EXE** is built into the code of that business application, then the program **LANGUAGES.PRG** is built into the code of the **APP.EXE** application, from which the procedures **AppSys()**, **DbeSys()** and **Main()**. All other procedures and functions remain the same - they are not touched:

Ako se tehnologija za rad sa više jezika u jednoj poslovnoj aplikaciji APP.EXE ugrađuje u kod te poslovne aplikacije, tada se u kod aplikacije APP.EXE ugrađuje program **LANGUAGES.PRG** iz koga se izbacе procedure AppSys(), DbeSys() i Main(). Sve ostale procedure i funkcije ostaju iste – ne diraju se:

The LANGUAGES.PRG program contains functions:

Program **LANGUAGES.PRG** sadrži funkcije:

**FUNCTION MAKE\_LANGUAGE()**

```
STATIC FUNCTION INSERT_ITEM()
STATIC FUNCTION DELETE_ITEM()
STATIC FUNCTION EDIT_LANGUAGE()
STATIC FUNCTION CH_file()
STATIC FUNCTION help_programa()
```

The **\_LANGUAGES.PRG** program contains functions:

Program **\_LANGUAGES.PRG** sadrži funkcije:

```
FUNCTION LNG_MSG( nMessage )
FUNCTION LNG_SET( applanguage, lSet, aLanguage )
FUNCTION create_language_list(LNGFILE)
STATIC FUNCTION fill_language_list(LNGFILE)
FUNCTION dc_langblock ( bBlock )
FUNCTION dc_langcustom( bBlock )
```

PRG and CH Programs must be linked to the APP.EXE application:

U aplikaciju APP.EXE moraju se linkovati PRG i CH programi:

**LANGUAGES.PRG,**  
**\_LANGUAGES.PRG,**  
**LANGUAGES.CH**

There must also be files in the LANGUAGES.EXE application folder  
Takođe u folderu aplikacije LANGUAGES.EXE moraju postojati fajlovi

**LANGUAGES.DBF**  
**LANGUAGES.INI**

## 5. DEFAULT APPLICATION PROJECT (USAGE) – DEFAULT APLIKACIONI PROJEKAT (UPOTREBA)

The source code of the default project for the default application LANGUAGES.EXE is supplied with this book, which contains the files:

Uz ovu knjigu isporučuje se izvorni kod default projekta za default aplikaciju LANGUAGES.EXE koji sadrži fajlove:

**LANGUAGES.BAT**  
**LANGUAGES.XPJ**  
**LANGUAGES.PRG**  
**\_LANGUAGES.PRG**  
**LANGUAGES.CH**

LANGUAGES.DBF  
LANGUAGES.INI

### 5.1.

The programmer should start the LANGUAGES.BAT program, which will create the LANGUAGES.EXE application via the LANGUAGES.XPJ project file and PRG and CH files.

Programer treba da startuje program LANGUAGES.BAT koji će preko projekt fajla LANGUAGES.XPJ i preko PRG i CH fajlova napraviti aplikaciju LANGUAGES.EXE

### 5.2.

The programmer should start the LANGUAGES.EXE application, for example in the C:\TEST folder, i.e. in the folder:

Programer treba da startuje aplikaciju LANGUAGES.EXE na primer u folderu C:\TEST odnosno u folderu:

C:\TEST\LANGUAGES.EXE

which will automatically create the initial files:

koja će automatski napraviti inicijalne fajlove:

C:\TEST\LANGUAGES.INI

C:\TEST\DBF\LANGUAGES.DBF

### 5.3.

The LANGUAGE.EXE application is initially started in ENGLISH LANGUAGE mode

The programmer should, from the LANGUAGE.EXE application, by clicking the Edit command button, make changes in the dictionary for ENGLISH and LOCAL LANGUAGE and adapt that dictionary to the APP.EXE business application.

He needs to make changes in the texts from code 1 to code 299 that are applied in all applications, that is, to translate all English texts into local texts. If necessary, to modify some existing English/local texts from 1 to 299, to delete unnecessary texts, to add new texts. In particular, it should add texts from code 300 onwards that refer only to a specific business application and are not used in other applications.

Aplikacija LANGUAGE.EXE inicijalno se startuje u modu rada ENGLESKI JEZIK

Programer treba da iz aplikacije LANGUAGE.EXE klikom na komandno dugme Edit izvrši izmene u rečniku za ENGLESKI i LOKALNI JEZIK i prilagodi taj rečnik poslovnoj aplikaciji APP.EXE.

Treba da izvrši izmene u tekstovima od koda 1 do koda 299 koji se primenjuju u svim aplikacijama, odnosno da sve engleske tekstove prevede u lokalne tekstove. Po potrebi da neke postojeće engleske/lokalne tekstove od 1 do 299 izmeni, da obriše bespotrebne tekstove, da doda nove tekstove. Posebno treba da doda tekstove od coda 300 pa na dalje koji se odnose samo na konkretnu poslovnu aplikaciju i ne koriste se u drugim aplikacijama.

### 5.4.

When the developer completes this job, the language database LANGUAGES.DBF is formed for the English language and the local language that the developer specified WITH THE BUSINESS APPLICATION MESSAGE DICTIONARY APP.EXE.

Now the file LANGUAGES.CH should be created from the data of the LANGUAGES.DBF file. This is done by clicking on the command button CH file, which automatically creates the file C:\TEST\\_\_LANGUAGES.CH and opens for viewing in the NOTEPAD.EXE editor.

The files LANGUAGES.DBF and \_\_LANGUAGES.CH are no longer the default (initial) files of the LANGUAGES.EXE program, but are now SPECIALIZED files intended for the BUSINESS APPLICATION APP.EXE

Kada programer završi ovaj posao baza podataka jezika LANGUAGES.DBF formirana je za engleski jezik i lokalni jezik koji je programer zadao SA REČNIKOM PORUKA ZA POSLOVNU APLIKACIJU APP.EXE.

Sada treba iz podataka fajla LANGUAGES.DBF formirati fajl LANGUAGES.CH.

To se radi klikom na komandno dugme CH file čime se automatski formira fajl

C:\TEST\\_\_LANGUAGES.CH

i otvara se za pregled u editoru NOTEPAD.EXE.

Fajlovi LANGUAGES.DBF i \_\_LANGUAGES.CH nisu više default (inicijalni) fajlovi programa LANGUAGES.EXE nego su sada SPECIJALIZOVANI fajlovi namenjeni ZA POSLOVNU APLIKACIJU APP.EXE

## 5.5.

The developer now inserts the LANGUAGES.INI, LANGUAGES.DBF, and \_\_LANGUAGES.CH files into the APP.EXE business application project after renaming it to LANGUAGES.CH. In each PRG file of the APP.EXE business application, the following command is entered: Programer sada u projekat poslovne aplikacije APP.EXE ubacuje fajlove LANGUAGES.INI, LANGUAGES.DBF i \_\_LANGUAGES.CH pošto ga prethodno preimenuje u LANGUAGES.CH. U svaki PRG fajl poslovne aplikacije APP.EXE upisuje se komanda:

```
#include LANGUAGES.CH
```

In the main() procedure of the APP.EXE application, at the beginning of this procedure, you should enter:

U main() proceduru aplikacija APP.EXE, na početak ove procedure, treba upisati:

```
PUBLIC ini := gde_exe()+"\LANGUAGES.INI"
PUBLIC applanguage, snLanguage
IF FILE(ini)==.F.
    DC_INIWRITE(ini,"LANGUAGE","applanguage","LOC") // formiraINI ako ga nema
ENDIF
applanguage := DC_INIREAD(ini,"LANGUAGE","applanguage")
* applanguage = "LOC" // App works with local language/App radi sa lokalnim jezikom
* applanguage = "ENG" // App works with English language/App radi sa engleskim
snLanguage := applanguage
LNG_SET( applanguage ) // __LANGUAGES.PRG
* ----- LANGUAGE.INI
```

In each PRG file of the APP.EXE application, where some text needs to be displayed and printed, that text is called via the LNG\_MSG(SYMBOLIC CONSTANT) function, for example: instead of:

U svaki PRG fajl aplikacije APP.EXE, gde treba izvršiti prikaz i štampu nekog teksta, taj tekst se poziva preko funkcije LNG\_MSG(SYMBOLIC CONSTANT) na primer:

instead of:

umesto:

```
DCREAD GUI OPTIONS GetOptions FIT TITLE "LANGUAGE SETTING :: ENGLISH and LOCALE"
```

enter:

upisuje se:

```
DCREAD GUI OPTIONS GetOptions FIT TITLE LNG_MSG(__APPNAME_)
```

## 5.6.

Now we need to relink and compile (build) the EXE application APP.EXE with its LANGUAGES.INI, LANGUAGES.DBF and LANGUAGES.CH files and with all its PRG files supplemented

Sada treba ponovo linkovati i kompajlovati (izgraditi) EXE aplikaciju APP.EXE sa njenim fajlom LANGUAGES.INI, LANGUAGES.DBF i LANGUAGES.CH i sa dopunjениm svim njenim PRG fajlovima

## 5.7

The user of the application is supplied for work:

Korisniku aplikacije isporučuje se za rad:

APP.EXE

LANGUAGES.EXE

LANGUAGES.DBF

LANGUAGES.INI

RunTime Alaska Xbase++ 2.0 and RunTime eXpress++ 2.0

Option: PostgreSQL server 9.4 or newer

## 6. DEFAULT APPLICATION PROJECT (FILES) – DEFAULT APLIKACIONI PROJEKAT (FAJLOVI)

### :: FILE: LANGUAGES.BAT

// LANGUAGES.CH
// SADRŽI <SYMBOLIC CONSTANTS> I NJIHOVE <RESULTS> NUMERIČKE VREDNOSTI
// I ZA SVAKU APLIKACIJU JE OVAJ <LANGUAGES.CH> SA RAZLIČITIM SADRŽAJEM.
// U NJEMU SE NE SME NIŠTA MENJATI JER JE SVE PREKO <RESULTS> POVEZANO
// SA PODACIMA IZ FAJLA <LANGUAGES.DBF> KOJI SADRŽI TEKSTOVE IZ PROGRAMA
// KOJI SE MOGU PRIKAZATI U DVA JEZIKA:
```

```

//          DCLANG_ENGLISH // engleski jezik
//          DCLANG_LOCALE   // korisnikov lokalni jezik
// TEKSTOVE ZA DCLANG_LOCALE U DBF UPISUJE I MENJA SAM KORISNIK PROGRAMA

// LANGUAGES.CH
// CONTAINS <SYMBOLIC CONSTANTS> AND THEIR <RESULTS> NUMERIC VALUES
// AND FOR EACH APPLICATION THERE IS THIS <LANGUAGES.CH> WITH DIFFERENT CONTENTS.
// NOTHING MUST BE CHANGED IN IT BECAUSE EVERYTHING IS CONNECTED THROUGH <RESULTS>
// WITH DATA FROM THE FILE <LANGUAGES.DBF> WHICH CONTAINS THE TEXTS FROM THE PROGRAM
// WHICH CAN BE DISPLAYED IN TWO LANGUAGES:
//          DCLANG_ENGLISH // English language
//          DCLANG_LOCALE // user's local language
// TEXTS FOR DCLANG_LOCALE IN DBF ARE WRITE AND CHANGED BY THE USER OF THE PROGRAM

* Ovde polje MARK_ sadrži naziv numeričke varijable kao string,
* Ovaj string naziv služi samo za bolje snalaženje - kako bi se korisnik
* snašao kod popunjavanja dbf liste poruka. Recno() je redni broj poruke
* odnosno redni broj člana array niza koji se dobija iz ove dbf
*
* Polje CODE_ sadrži numerički kod poruke a polje TEXT_ sadrži tekst poruke
* i ova sva polja se prebacuju u array niz koji se koristi od strane aplikacije
* za prevodenje teksta na zadati jezik
* ---
* Here the field MARK_ contains the name of the numeric variable as a string,
* This string name is only for better navigation - so that the user
* figured out how to populate the dbf message list. Line() is the sequence number of
* the message
* that is, the sequence number of the member of the array string that is obtained from
* this dbf
*
* The field CODE_ contains the numerical code of the message and the field TEXT_
* contains the text of the message
* and all these fields are transferred to an array used by the application
* to translate the text into the given language

## APPENDIX

LANGUAGES.ZIP file with all LANGUAGES.XPJ project files

## PRILOG

Fajl LANGUAGES.ZIP sa svim fajlovima projekta LANGUAGES.XPJ

## CONCLUSION

This would be all about one method, out of the many existing methods, to work with multiple languages in one business application.

My point of view that an application should have English as its base language, and as a local language only one language that the user of the application speaks and that the user can change, may be controversial for some. In that case, different solutions are possible in this technology of mine, as well as with other software solutions. But one thing is a fact: this is a very big and tiring job and few people start it without a great and justified need. Somewhere on the eXpress forum, Tom once said about that job: "**but this is really a monkey job**"

<http://bb.donnay-software.com/Donnay/viewtopic.php?f=9&t=3191&p=19366&hilit=language#p19366>

## ZAKLJUČAK

Ovo bi bilo sve o jednom metodu, od brojnih postojećih metoda, za rad sa više jezika u jednoj poslovnoj aplikaciji.

Moje stanovište da jedna aplikacija treba da ima kao bazni jezik engleski jezik, a kao lokalni jezik samo jedan jezik kojim govori korisnik aplikacije i koji taj korisnik može da menja, može da bude za nekoga sporno. U tom slučaju moguća su drugačija rešenja i u ovoj mojoj tehnologiji, kao i sa drugim programskim rešenjima. Ali jedna stvar je činjenica: ovo je jako veliki i naporan posao i malo ko ga bez velike i opravdane potrebe započinje. Negde na eXpress forumu jednom za taj posao reče Tom: "**ali ovo je stvarno majmunski posao**"

<http://bb.donnay-software.com/Donnay/viewtopic.php?f=9&t=3191&p=19366&hilit=language#p19366>
